✅ **Verify Session is Being Maintained:**

Ensure that your session driver (in `.env`) is working properly:

env   ⎘ Copy code

```
SESSION_DRIVER=file
```

Make sure the session file directory (`storage/framework/sessions`) is writable.

✅ **Exceptions:**

If this is happening on a webhook or API endpoint, and CSRF protection isn't needed, you can exclude the route in `VerifyCsrfToken.php`:

php   ⎘ Copy code

```php
protected $except = [
    '/webhook/endpoint',
];
```

⚠️ Be careful: disabling CSRF should only be done for routes that don't need it, like external webhooks.

Debugging Tips:

- Try clearing the cookies and cache.
- Use Laravel's `php artisan config:clear` and `php artisan cache:clear`.
- Check if the session is being stored properly.
- If using a custom domain or subdomain, ensure `SESSION_DOMAIN` is set correctly.

Let me know how you're using the form or API (Blade, Vue, React, etc.), and I can give more tailored help.
